

Slurry storage in steel silo

Silo

The silo consists of corrugated steel plates. These are hot zinc dipped and fully coated with a polyurethane coating.

Silo liner

The liner for this silo consists of 1 mm thick Fecatex® PVC foil for the bottom and Genatex® 850, reinforced PVC foil, for the walls. The liner has an edge with an overlap of Genatex® 850 with stainless steel rings. The liner is fixated to the silo with dralon cord.

We supply protection sheets to place in between the steel silo and the liner, for protection of the liner. This can also be used on the bottom.

This liner meets the European construction guidelines for manure storage and has a KIWA certificate. The liner guarantees a waterproof system, which prevents contamination of ground water.

Silo cover

You can create a completely closed system by installing a cover. We offer several solutions.
